Data With Danny Case Studies Getting Started Resources About

Case Study #1 - Danny's Diner

Danny Ma · May 1, 2021

DATAWITHDANNY.COM

Introduction

Danny seriously loves Japanese food so in the beginning of 2021, he decides to embark upon a risky venture and opens up a cute little restaurant that sells his 3 favourite foods: sushi, curry and ramen.

Danny's Diner is in need of your assistance to help the restaurant stay afloat - the restaurant has captured some very basic data from their few months of operation but have no idea how to use their data to help them run the business.

Danny wants to use the data to answer a few simple questions about his customers,

Problem Statement

especially about their visiting patterns, how much money they've spent and also which menu items are their favourite. Having this deeper connection with his customers will help him deliver a better and more personalised experience for his loyal customers.

He plans on using these insights to help him decide whether he should expand the existing

customer loyalty program - additionally he needs help to generate some basic datasets so his team can easily inspect the data without needing to use SQL. Danny has provided you with a sample of his overall customer data due to privacy issues -

but he hopes that these examples are enough for you to write fully functioning SQL queries

sales

Danny has shared with you 3 key datasets for this case study:

menu members

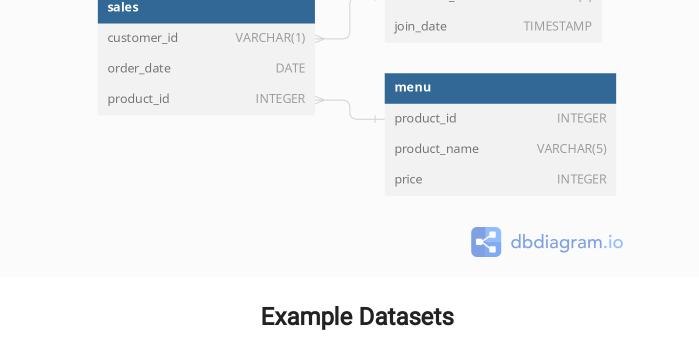

to help him answer his questions!

You can inspect the entity relationship diagram and example data below.

Entity Relationship Diagram

members customer_id

VARCHAR(1)

All datasets exist within the dannys diner database schema - be sure to include this reference within your SQL scripts as you start exploring the data and answering the case study questions.

Table 1: sales

The sales table captures all customer id level purchases with an corresponding order date and product id information for when and what menu items were ordered.

2021-01-01	1
2021-01-01	2

Α	2021-01-07	2
А	2021-01-10	3
A	2021-01-11	3
А	2021-01-11	3
В	2021-01-01	2
В	2021-01-02	2
В	2021-01-04	1
В	2021-01-11	1
В	2021-01-16	3
В	2021-02-01	3
С	2021-01-01	3
С	2021-01-01	3

Table 2: menu

2021-01-07

3

C

The menu table maps the product_id to the actual product_name and price of each menu item.

product_id	product_name	price		
1	sushi	10		
2	curry	15		
3	ramen	12		
Table 3: members				

The final members table captures the join_date when a customer_id joined the beta

version of the Danny's Diner loyalty program.

	customer_id	join_date			
	А	2021-01-07			
	В	2021-01-09			
Interactive SQL Session					

You can use the embedded DB Fiddle below to easily access these example datasets - this

interactive session has everything you need to start solving these questions using SQL.

You can click on the Edit on DB Fiddle link on the top right hand corner of the embedded

session below and it will take you to a fully functional SQL editor where you can write your own queries to analyse the data.

You can feel free to choose any SQL dialect you'd like to use, the existing Fiddle is using

Serious SQL students have access to a dedicated SQL script in the 8 Week SQL Challenge section of the course which they can use to generate relevant temporary tables like we've

PostgreSQL 13 as default.

done throughout the entire course!

```
Schema SQL
               Query SQL Results
                                                                                Edit on DB Fiddle
CREATE SCHEMA dannys diner;
SET search path = dannys diner;
CREATE TABLE sales (
  "customer id" VARCHAR(1),
  "order date" DATE,
  "product id" INTEGER
INSERT INTO sales
  ("customer id", "order date", "product id")
VALUES
  ('A',
        '2021-01-01', '1'),
  ('A', '2021-01-01', '2'),
  ('A', '2021-01-07', '2'),
  ('A', '2021-01-10', '3'),
  ('A', '2021-01-11', '3'),
  ('A', '2021-01-11', '3'),
  ('B', '2021-01-01', '2'),
  ('B', '2021-01-02', '2'),
('B', '2021-01-04', '1'),
  ('B', '2021-01-11', '1'),
  ('B', '2021-01-16', '3'),
  ('B', '2021-02-01', '3'),
  ('C', '2021-01-01', '3'),
  ('C', '2021-01-01', '3'),
  ('C', '2021-01-07', '3');
CREATE TABLE menu (
 "product id" INTEGER,
  "product name" VARCHAR(5),
 "price" INTEGER
INSERT INTO menu
  ("product id", "product name", "price")
VALUES
  ('1', 'sushi', '10'),
  ('2', 'curry', '15'),
  ('3', 'ramen', '12');
CREATE TABLE members (
  "customer id" VARCHAR(1),
  "ioin date" DATE
                              Case Study Questions
```

Each of the following case study questions can be answered using a single SQL statement:

What is the total amount each customer spent at the restaurant?

- 2. How many days has each customer visited the restaurant?3. What was the first item from the menu purchased by each customer?
- 4. What is the most purchased item on the menu and how many times was it purchased
- by all customers?
- 5. Which item was the most popular for each customer?
- 6. Which item was purchased first by the customer after they became a member?
- 7. Which item was purchased just before the customer became a member?8. What is the total items and amount spent for each member before they became a
- member?
- 9. If each \$1 spent equates to 10 points and sushi has a 2x points multiplier how many points would each customer have?

10. In the first week after a customer joins the program (including their join date) they earn 2x points on all items, not just sushi - how many points do customer A and B have at the end of January?

Bonus Questions

Join All The Things

The following questions are related creating basic data tables that Danny and his team can use to quickly derive insights without needing to join the underlying tables using SQL.

Recreate the following table output using the available data:

customer_id	order_date	product_name	price	member
А	2021-01-01	curry	15	N
А	2021-01-01	sushi	10	N
А	2021-01-07	curry	15	Υ
А	2021-01-10	ramen	12	Υ
А	2021-01-11	ramen	12	Υ
А	2021-01-11	ramen	12	Υ
В	2021-01-01	curry	15	N
В	2021-01-02	curry	15	N
В	2021-01-04	sushi	10	N
В	2021-01-11	sushi	10	Υ
В	2021-01-16	ramen	12	Υ
В	2021-02-01	ramen	12	Υ
С	2021-01-01	ramen	12	N
С	2021-01-01	ramen	12	N
С	2021-01-07	ramen	12	N

Danny also requires further information about the ranking of customer products, but he

Rank All The Things

purposely does not need the ranking for non-member purchases so he expects null ranking values for the records when customers are not yet part of the loyalty program.

customer_id order_date product_name price member ranking

custoffici_lu	order_date	product_name	price	member	ranking
А	2021-01-01	curry	15	N	null
А	2021-01-01	sushi	10	N	null
А	2021-01-07	curry	15	Υ	1
А	2021-01-10	ramen	12	Υ	2
A	2021-01-11	ramen	12	Υ	3
А	2021-01-11	ramen	12	Υ	3
В	2021-01-01	curry	15	N	null
В	2021-01-02	curry	15	N	null
В	2021-01-04	sushi	10	N	null
В	2021-01-11	sushi	10	Υ	1
В	2021-01-16	ramen	12	Υ	2
В	2021-02-01	ramen	12	Υ	3
С	2021-01-01	ramen	12	N	null
С	2021-01-01	ramen	12	N	null
С	2021-01-07	ramen	12	N	null
Next Steps					
		. 10/11 010/0			

trying to solve the problems in the provided SQL Fiddle instance above!

It's highly recommended to save all of your code in a separate IDE or text editor as you are

If you'd like to use this case study for one of your portfolio projects or in a personal blog post - please remember to link back to this URL and also don't forget to share some

LinkedIn updates using the **#8WeekSQLChallenge** hashtag and remember to tag me!

Ready for the next 8 Week SQL challenge case study? Click on the banner below to get started with case study #2!

Conclusion

I really hope you enjoyed this fun little case study - it definitely was fun for me to create!

Official Solutions

If you'd like to see the official code solutions and explanations for this case study and a whole lot more, please consider joining me for the Serious SQL course - you'll get access to all course materials and I'm on hand to answer all of your additional SQL questions directly!

Serious SQL is priced at \$49USD and \$29 for students and includes access to all written course content, community events as well as live and recorded SQL training videos!

Please send an email to support@datawithdanny.com from your educational email or include your enrolment details or student identification for a speedy response!

The following topics relevant to the Danny's Diner case study are covered lots of depth in the Serious SOL course:

- Common Table Expressions
- Group By Aggregates
- Window Functions for ranking
- Table Joins

Don't forget to review the comprehensive list of SQL resources I've put together for the 8 Week SQL Challenge on the Resources page!

This section will be updated in the future with any community member solutions with a link

Community Solutions

to their respective GitHub repos!

Final Thoughts

The 8 Week SQL Challenge is proudly brought to you by me - Danny Ma and the Data With

Danny virtual data apprenticeship program. Students or anyone undertaking further studies are eligible for a \$20USD student discount

off the price of Serious SQL please send an email to support@datawithdanny.com from your education email or include information about your enrolment for a fast response! We have a large student community active on the official DWD Discord server with regular

live events, trainings and workshops available to all Data With Danny students, plus early discounted access to all future paid courses. There are also opportunities for 1:1 mentoring, resume reviews, interview training and

more from myself or others in the DWD Mentor Team. From your friendly data mentor, Danny:)
